Tideland Signal Corporation Announces LED Replacement for FA-240 Pharos Range Light

Over the past 12 months the Canadian Coast Guard has continued to implement their move to aid modernization and the use of LED lights where possible. With the addition of the new Tideland Signal ALS-240/1 conversion kit, the move is to retrofit the old but reliable FA-240 Range light.

The ALS-240/1 is a simple and economic retrofit with several advantages:

- It eliminates the need to test and manipulate the individual lamps for focusing in individual lampchanger assemblies.
- It draws less than 100 mA (12V input) under full load and 50 mA at half power, making it very suitable for solar conversions.
- It mimics the original incandescent characteristics and out performs virtually every lamp used in the system.
- Maintenance intervals are reduced due to the longevity of and LED light source. Field service is simplified with the ability to change out just the LED light source instead of the complete lantern.

Coast Guard Bases from East ERN to West ERN Canada are using the new ALS-240/1. The responses are extremely positive and the orders keep coming in for this product.

Installed ALS-240/1 in FA-240 Range Light
